The present invention relates to a coding sequence with a heterologous futron for treating diseases. The invention is also useful for obtaining a transgenic plant having increased resistance to an external stress such as herbicide, a pathogen or pest or an unfavourable environmental factor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                tissue relating to obesity, particularly complications of visceral obesity including diabetes, hyperlipemia, hypertension, arteriosclerosis, hyperticemia and sleep apnea syndrome. The genes (AAZ90631-633) and the proteins (AAY67598-X67600) are used in the genetic diagnosis, prevention and treatment of adipose tissue related diseases. Sequences AAZ90640-51 represent PCR primers amplifying the human adipose tissue genes
                                                                                                                                                                                                                                                                                                                      A physiologically active protein specifically derived from mammal tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to identification of genes and proteins of adipose
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Polynucleotides having a heterologous intron, useful for manufacturing medicaments for treating human and animal diseases, by stable

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Efficient sequencing of long DNA by fragment walking - with simultaneous sequencing of restriction enzyme fragment and adjacent region of intact DNA, avoids the need for cloning and requires fewer primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A method for DNA analysis based on a complementary extension reaction using a DNA polymerase, comprises a combination of fragment walking and MNA sequencing. DNA fragments are formed by digestion of DNA with a restriction enzyme and the targeted DNA sequence can be determined directly from the digested DNA fragments. By exploring the overlapping sequence of the determined base sequence, the overall base sequence of a lengthy DNA can be determined with low redundancy without cloning or subcloning. In addition, the method can be done with commercially available universal primers or with fewer primers than required in existing methods. AAT73291-92 are primers used in determination of the
                                                                                                                                                                                                                                                                                              primer; PCR; polymerase chain reaction; sequencing; walking;

Efficient sequencing of long DNA by fragment walking - with simultaneous sequencing of restriction enzyme fragment and adjacent region of intact DNA, avoids the need for cloning and requires fewer primers.
                                                                                                                                                                                                                                                                                                                                                                                                                               A method for DNA analysis based on a complementary extension reaction using a DNA polymerase, comprises a combination of fragment walking and DNA sequencing. DNA fragments are formed by digestion of DNA with a restriction enzyme and the targeted DNA sequence can be determined directly from the digested DNA fragments. By exploring the overlapping sequence of the determined base sequence, the overall base sequence of a lengthy DNA can be determined with low redundancy without cloning or subcloning. In addition, the method can be done with commercially available universal primers or with fewer primers than required in existing methods. AAT73291-92 are primers used in determination of the public sequence. Primer extension was carried out using 16 primers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Anti-Fas antibody; monoclonal antibody HFE7A; FERM-BP-5828; murine; humanised antibody; complementarity determining region; CDR; human Fas; Fas ligand; apoptosis modulator; programmed cell death; autoimmune disease; allergy; atopy; arteriosclerosis; myocarditis; cardiomyopathy; glomerulonephritis; aplastic anaemia; panmyelophthisis; hepatitis; AIDS; graft rejection; heavy chain; sequencing primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    용
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Efficient sequencing of long DNA by fragment walking - with simultaneous sequencing of restriction enzyme fragment and adjacent region of intact DNA, avoids the need for cloning and requires fewer primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A method for DNA analysis based on a complementary extension reaction using a DNA polymerase, comprises a combination of fragment walking and DNA sequencing. DNA fragments are formed by digestion of DNA with a restriction enzyme and the targeted DNA sequence can be determined directly from the digested DNA fragments. By exploring the overlapping sequence of the determined base sequence, the overlapping sequence of the determined with low redundancy without cloning or subcloning. In addition, the method can be done with commercially available universal primers or with fewer primers than required in existing methods. AT73291-92 are primers used in determination of the purch as a purch sequence out using 16 primers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 primer; PCR; polymerase chain reaction; sequencing; walking;

The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFB7A, or a humanised version of HFB7A containing identical CDFS (complementarity determining regions) to antibody HFB7A. Via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, actory, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephitis, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephitis, rejection. The present sequence represents a humanised HFB7A-derived antires antibody heavy chain sequencing primer used in an exemplification of the invention. (Updated on 15-SEP-2003 to standardise OS field)
                                                                                                                                                                              Preventive or treating agent for the diseases caused by an abnormality in the Fas/Fas ligand system e.g. autoimmune diseases, contains anti-Fas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Anti-Fas antibody; monoclonal antibody HFB7A; FERM-BP-5828; murine; humanised antibody; complementarity determining region; CDR; human Fas; Fas ligand; apoptosis modulator; programmed cell death; autoincule disease; allergy; atopy; arteriosclerosis; myocarditis; cardiomyopathy; glomerulonephritis; aplastic anaemia; panmyelophthisis; hepatitis; AlDS; graft rejection; heavy chain; sequencing primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Humanised anti-Fas antibody heavy chain primer, SEQ ID NO:98.

The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFB7A, or a humanised version of HFB7A containing identical CDRs (complementarity determining regions) to antibody HFB7A. Via its interaction with Fas, the antibody of the invention may therefore be used in the treatment or prevention of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephitis, aplastic anaemia (panmyelophthisis), hepatitis, AIDS and organ graft rejection. The present sequencing primer used in an exemplification of the antibody heavy chain sequencing primer used in an exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to the use of a compound comprising an amino acid sequence His-Phe-Arg-Trp (HFRW) in the manufacture of a medicament and/or an agonist of melanocortin receptor type 3 (MC3-R) where the compound is not adrenocorticotrophic hormone (ACTH) 1-39. The compounds are used to inhibit neutrophil chemoattractant production, polymorphomuclear cell (PMN) accumulation or reduction/treatment of inflammation. Especially,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas ligand system, by binding to Fas on the cell surface, and prevents apoptosis in cells with a normal system, by inhibiting binding between Fas and its ligand. The products of the invention have anti-inflammatory, anti-anemic, anti-allergic, anti-arthritic, antiviral, antirheumatic, nephrotropic, inmunosuppressive, thyronimetic, antirheumatic, nephrotropic, antiinfertility, neuroprotective, antiatreriosclerotic, cardiant and hepatropic activity. (I) induce apoptosis by binding to cell surface Fas or inhibit it by competitive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New humanized anti-Fas antibody, useful for treating or preventing e.g. inflammatory or autoimmune disease, induces apoptosis selectively in cells with abnormal Fas-Fas ligand systems.
these compounds are agonists of the MC3-R. The inflammatory response/disease is selected from gout, gouty arthritis, rheumatoid arthritis, asthma, reperfusion injury or damage, stroke, myocardial infarction, septic shock, or a skin disorder. Sequences AAZ57073-80 represent PCR primers used for amplifying murine melanocortin receptors
                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Fas; antibody; human; anti-inflammatory; anti-anemic; antidiabetic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes a novel humanized anti-Fas antibody-like
                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Takahashi T;

inhibition of ligand binding. (I) are used to treat and/or prevent diseases associated with the Fas/Fas ligand system, especially systemic lupus erythematosus, Hashimoto disease, rheumatoid arthritis, graft versus host disease, Sjorgen's syndrome, pernicious or hypoplastic anemia, Addison's disease, scleroderma, Goodpasture syndrome, Crohn's disease, autoimmune hemolytic anemia, Goodpasture syndrome, Crohn's multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin dependent diabetes mellitus, allergy, atteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral (B, C or D) or alcoholic), and transplant rejection. (I) selectively cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they minic the native ligand, do not induce liver disease, and have reduced risk of inducing a human anti-murine antibody response. This sequence represents primer used in the construction of a humanised anti-Fas antibody HFE7A ö Fas; antibody; human; anti-inflammatory; anti-anemic; antidiabetic; dernatiological; anti-arthritic; antiviral; immunomodulatory; cardiant; dermatological; immunosuppressive; thyromimetic; antirheumatic; anti-Fas; nephrotropic; antiinfertility; neuroprotective; antiarteriosclerotic; hepatotropic; humanized; apoptosis; systemic lupus erythematosus; Hashimoto disease; rheumatoid arthritis; graft versus host disease; sjorgen's syndrome; anemia; Addison's disease; scleroderma; sterility; Goodpasture syndrome; Crohn's disease; aterility; myasthenia gravis; multiple sclerosis; basedow's disease; thrombopenia purpura; allergy; insulin dependent diabetes mellitus; arteriosclerosis; myocarditis; cardiomyopathy; glomerulonephritis; hepatitis; transplant rejection; New humanized anti-Fas antibody, useful for treating or preventing e.g. inflammatory or autoimmune disease, induces apoptosis selectively in cells with abnormal Fas-Fas ligand systems. The superior is described a novel numanized anti-Fras antibody-like molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas ligand system, by binding to Fas on the cells with an abnormal Fas/Fas ligand system, by binding to Fas on the cells with an abnormal Fas/Fas ligand system, by inhibiting binding between Fas and its ligand. The products of the invention have anti-inflammatory, anti-arterior, anti-arthritic, anti-inflammatory, anti-arthritic, anti-arthritic, anti-inflammatory, anti-arthritic, anti-arthritic, anti-inflammatory, anti-arteriors anti-arthritic, anti-arthritic, anti-inflammatory, anti-arthritic, anti-inflammatory, anti-arteriors anti-arteriors cardiant and hepatropic activity. (I) induce anti-arteriors of ligand binding (I) are used to treat and/or prevent chiesases associated with the Fas/Fas ligand system, especially systemic diseases associated with the Fas/Fas ligand system, especially systemic contents, has himmoto disease, remarcious or hypoplastic canomia, Addison's disease, solorgen's syndrome, pernicious or hypoplastic canomia, Addison's disease, solorgen's syndrome, pernicious or hypoplastic canomia, Addison's disease, solorgen's syndrome, pernicious or hypoplastic canomia, Addison's disease, solorgen's syndrome, sterility, myasthenia gravia, canomia, Addison's disease, solorgen's disease, solorgen's short anti-arteriors and transplant rejection. (I) selectively induced abettes mellitus, allergy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, hepaticis (fulminant, chronic, viral CC inhibit apoptosis in normal cells but selectively induce it in abnormal cells appeaded models. (I) act on the active site of Fas, i.e. they mimic cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they mimic cells. They bind to both human anti-murine antibody these conformation of a human anti-murine antibody areasons. This sequence represents conformation and the active site of fas antibody h

Drug for preventing or treating e.g. autoimmune disease or allergy, comprises humanized anti-Fas antibody. WPI; 2002-145114/19.

ö The invention relates to a preventive or treating agent for diseases caused by abnormality in the Fas/Fas ligand system containing, as the active component, an antibody having a light chain subunit and a heavy chain subunit and an activity of combining specifically with mammalian Fas and an activity of inducing apoptosis in a cell expressing Fas. The agent has antiallergic, immunosuppressive and apoptotic activity and is used for preventing and treating autoimmune diseases, allergy, atopy and others. The present sequence is that of a PCR primer useful in the construction of anti-Pas antibodies of the invention Gaps ö 0.9%; Score 15.4; DB 1; Length 20; 94.1%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Diagnosing hepatitis B virus (HBV) infection stages and determining the risk for hepatocellular carcinoma, comprises identifying full length HBV transcripts and truncated HBV transcripts in a serum sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to diagnosis of hepatitis B virus (HBV) infection stages comprising identification of full length HBV transcripts (I) and truncated HBV transcripts (II) in a serum sample, where the ratio of I:I is indicative of a particular infection stage. The method is useful for diagnosing HBV infection stages and determining the risk for developing hepatocellular carcinoma. The present sequence is that of a HBV diagnostic PCR primer, useful for the invention
                                                                                                                                                                                                                                                                                                       Hepatitis B virus, HBV, infection, hepatocellular carcinoma, diagnosis, PCR primer; ss.

The invention relates to a preventive or treating agent for diseases caused by abnormality in Fas/Fas ligand system containing as the active component an antibody having as the light chain subunit a polymeptide containing residues 1-218 of one of 3, 39 residue amino acid sequences, or residues 1-451 of one of 3, 470 residue amino acid sequences, all fully defined in the specification and having an activity of combining specifically with mammalian Fas and an activity of inducing apoptosis in a cell expressing Fas. The agent has immunosuppressive and antiallargic activity and is used for preventing and treating autoimmune diseases, allegy, atopy and others. The present sequence is that of a PCR primer,
                                                                                                                                                                                                                                                                                                                                                                                                Length 20;

WPI; 2003-229219/22.

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone.

Disclosure; SEQ ID NO 4731; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention

immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO has antiinflammatory, antiallergic, antiasthmatic, hypotensive, ftp.wipo.int/pub/published\_pct\_sequences

Two splice variants of this sequence are given. The nucleic acid molecules, proteins and methods are useful for treating autoimmune diseases such as multiple sclerosis, inflammatory bowel disease, rheumatoid arthritis, type I and type II diabetes, allergies and asthma. The present sequence is a PCR primer used to isolate the human IL-22BP gene, also known as LICR-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New LICR-2 nucleic acid molecule encoding a cytokine receptor useful f
treating autoimmune diseases such as multiple sclerosis, inflammatory
bowel disease, rheumatoid arthritis, type I and type II diabetes,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; IL-22BP; chromosome 1; LICR-2; STAT activation; Class II; cytokine receptor; nootropic; antiinflammatory; antiirheumatic; antiarthritic; antidiabetic; antiallergic; antiathmatic; diabetes; autoimmune disease; multiple sclerosis; inflammatory bowel disease;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence represents a primer of the invention. The invention relates to sequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta and; or (X)m5'-(gamma) k-delta-N3'; owere X = a labelled compound and/or a nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n = natural number indicating the repetition of alpha; beta, delta = V or N; V = adenine, guanine or cytosine; N = adenine, guanine or thymine; famma = thymine; k = natural number of 3 or over indicating the repetition of gamma, in which thymine expressed by gamma is composed of 1;3 or less of adenine, guanine and/or cytosine. The new nucleotides are useful as primers for RT-PCR and determination of base sequences. The new sequences allow for reproductive and highly efficient analysis of gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Peptides having at least two new nucleotides – useful as primers in RT-
                                                                                                                                                                                                                                                                                        RT-PCR primer; DNA sequence determination; gene sequence analysis; ss.

The invention relates to a probe set for gene expression arrays to provide common equivalent signalling per probe and global amplification of the set. The probe set has a pool of modified cDNA probes, each probe having a central target specific segment copied from a portion of a single mRNA transcript and a universal linker (a WRAP-Probe) located on one or both terminal ends. The universal linker has reporter binding eites to join common reporters to the probes and primer binding sites to copy and amplify the probe. The probes and reporters are useful in diagnostic or drug discovery assays for a wide range of biomedical cappanes, including detection of nucleic acids and gene expression profiles in human diagnostics, forensics and genomic analysis. The methods are useful for amplifying and identifying any unknown DNA fragment and also for improving sensitivity with tissue microarrays or kny arrays. The methods improve the quantification of gene expression and allow highly improved detection of rare transcripts or very small samples. This sequence represents a poly-T primer used in the
                                         WRAP-Probe; gene expression array; global amplification; RNA array; ss; tissue microarray; drug discovery assay; reporter binding site; forensic; diagnostic; genomic analysis; universal linker; poly-T primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel probe sets with common universal linkers at one or both ends (WRAP probes) for gene expression arrays to provide global amplification of probe set and to provide common equivalent signaling regardless of
Modified Poly-T Primer #1 used in construction of probe sets.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 17 BP; 0 A; 0 C; 0 G; 15 T; 0 U; 2 Other;

(SAYA/) SAYAMA

The primers (AAQ55811-841) are used to detect various types of hepatitis of virus. The primers are made from oligo DNA fragments selected from specific hepatitis C virus subtypes. The primers can be used to in a one step PCR reaction which can determine the subtypes of a large number of

```
Anti-sense polynucleotide complementary to VEGF sequence - inhibit growth factor expression and are used for diagnosis and treatment of cancer and
DNA sequence fragments were determined and of these, 277 were suitable for STS primer prediction by computer analysis (using the "Primer" program available from E.Lander, MIT). The STSs and cosmids were mapped by in situ hybridisation, sometic cell hybrid analysis or both. Using this method, 370 STSs specific for human chromosome 11 were generated an most of them were regionally mapped. This procedure illustrates a novel method for sequencing complex, genomes, designated "sequence sampled mapping". The sequence sampled mapping method is useful for the completion of high density sequence-based maps, and ultimately, for the complete sequencing of genomic DNA directly from cosmid clones. See AAQ82001-082706 for STS primers. (Updated on 25-MAR-2003 to correct PN

AAT10129 and AAT10130 represent oligonucleotides used within the invention. These sequences were used to determine the antisense oligonucleotides of the invention (see AAT10121-T10128). These sequences are antisense oligonucleotides complementary to at least 8 consecutive nucleotides of the vascular endothelial growth factor (VEGF) gene (see AAT10120). These antisense sequences inhibit the expression of VEGF to below 30% of normal expression. The antisense oligonucleotides may be used in diagnosis and treatment of diseases involving VEGF expression and associated abnormal angiogenesis, such as cancer, rheumatoid arthritis

primers shown in AAT1844-55 were used for reverse transcriptase-
polymerase chain reaction (RT-PCR) analysis of interleukin-1-beta
converting enzyme (ICE) -/- mice, to show that they do not express full-
length ICE mRNA transcripts. Using a 5' primer specific for exon 2 and a
series of 3' primers specific for each consecutive exon upto exon 10,
colly transcripts contgo. exons 2-5 were detected in ICE -/- animals. A 5'
primers specific for the neomycin gene and a series of 3' primers specific
for the neomycin gene and a series of 4'- animals.
Continies specific for the neomycin gene and a series of 4'- animals.
Continies specific for the neogene detected a transcript in ICE +/- and -/-
but not +/+ animals. The results of RT-PCR analyses and Northern
hybridisation confirmed that homozygous disruption of the ICE gene
cresults in an absence of detectable full-length ICE mRNA transcripts in
the ICE -/- mice. ICE deficient mice are useful as positive controls to
evaluate the efficacy of ICE inhibitors and to identify disease
conditions that can be treated with ICE inhibitors. Transgenic non-human
animals having functionally disrupted endogenous ICE genes but which has
been reconstituted with human ICE gene can be used to identify agents

A method has been developed for detecting the presence of a target site (TS), of at least one nucleotide (nt) in a nucleic acid (NA). The method comprises (a) forming an oligonuclectide (ON), consisting of two fluorophores (F1, F2) each covalently linked to separate nt, bound to TS; and (b) detecting fluorescence energy transfer (FET) between F1 and F2 when ON is released from TS. The present sequence represents a synthetic polynuclectide used in an example of the present invention. The method is used to diagnose hereditary and other diseases; to determine infectious agents; in tissue typing for histocompatibility; in forensic identification and paternity testing, and in monitoring the genetic make up of plants and animals. Specifically it is used to detect single nt polymorphisms. The method provides inexpensive, simple, accurate and automatable nucleic acid analyses
                                                                                                                                                                                                                                                                                                                                                                       Detection; target site; nucleic acid; fluorophore; labelled; fluorescent; inherited disease; tissue typing; PCR; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Detecting target site in nucleic acid by forming a fluorophore-labelled oligonucleotide at the site - and detecting fluorescent energy following denaturation, used e.g. to detect inherited diseases, in tissue typing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0.9%; Score 15.2; DB 1; Length 20;

A method has been developed for detecting the presence of a target site (TS), of at least one nucleotide (nt) in a nucleic acid (NA). The method comprises: (a) forming an oligonucleotide (ON), consisting of two fluorophores (F1, F2) each covalently linked to separate nt, bound to TS; and (b) detecting fluorescence energy transfer (FET) between F1 and F2 when ON is released from TS. The present sequence represents a synthetic polynucleotide used in an example of the present invention. The method is used to diagnose hereditary and other diseases; to determine infectious agents; in tissue typing for histocompatibility; in forensic identification and paternity testing, and in monitoring the genetic make up of plants and animals Specifically it is used to detect single nt polymorphisms. The method provides inexpensive, simple, accurate and automatable nucleic acid analyses
                                                                                                Detection, target site, nucleic acid, fluorophore, labelled, fluorescent, inherited disease, tissue typing, PCR, ss.
                                                                                                                                                                                                                                                                                                                                                                                                                          Detecting target site in nucleic acid by forming a fluorophore-labelled oligonuclectide at the site - and detecting fluorescent energy following denaturation, used e.g. to detect inherited diseases, in tissue typing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Microorganism inhibitor; antisense; nuclease resistant; treatment; ribonucleotide reductase; secA gene; pathological condition; R1 subunit; antimicrobial agent; crop protection; primer; R2 subunit; ss.

PCR primers AA237136-237137 are used to amplify the TANGO 125 (T125) gene PCR primers AA237136-237137 are used to amplify the TANGO 125 (T125) gene (AA237131). The T125 procein has two epidermal growth factor (EGF)-like domains at amino acids 107-134 and 141-176 and is predicted to have a molecular weight of approximately 30kD. T125 is predicted to have a caretaclar weight of approximately 30kD. T125 is predicted to have no transmembrane domains and appears to be a secreted protein. There are three alternatively spliced forms of T125: T125b and T125c and T125c (AA237132-237135). The sequences of all variants of T125 are used in the invention to create antibodise which selectively bind to T125. The T125 polypeptide is used to modulate a variety of cellular processes. It can broduce antibodies, and to identify T125 antagonists and agonists. The T125 polymucleotides, polypeptides, homologues and antibodies can be used to recenting assays; predictive medicine; and methods of treatment of the separation associated disorders. The T125 polymucleotides can be used to express the protein; to detect T125 mRNA; to detect genetic alterations in the T125 gene; in forensic biology; and as a source of primers and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New polynucleotides encoding secreted human proteins, derived from human fetal brain, adult skin, adult brain, adult heart, adult thymus and adult aorta cDNA libraries.

This invention describes novel human secreted proteins which are encoded by polynucleotides obtained from fetal brain, adult skin, adult thymus and adult acrta cDNA libraries. The adult thymus and adult acrta cDNA libraries. The polynucleotides and proteins are predicted to have biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, cytokine and cell proliferation/differentiation activity, immune stimulating (e.g. as vaccines) or suppressing activity, hematopoisesis regulating activity, chemotactic/chemokinetic activity, hemostatic and thrombolytic activity, chemotactic/chemokinetic activity, hemostatic and thrombolytic activity, receptor/ligand activity, anti-inflammatory activity, cadherin/tumor invasion suppressor activity, and tumor inhibition activity. The polynucleotides are also stated to be useful for gene therapy. AAZ43809-represented in AAX43777-z43808 which encode the secreted proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Liver glycogen phosphorylase; PYGL gene; human; chromosome 14; 1,4-alpha-D-glucan:orthophosphate alpha-D-glucosyltransferase; HGLPa; glycogenolysis; carbohydrate metabolism; blood glucose homeostasis; expression inhibition; hypoglycaemic; type II diabetes; non insulin-dependent; antisense; phosphorothioate; ss.

            AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ7440 represent amplification primers for the biallelic markers. The biallelic markers of the invention bave a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and disgnostic methods, as well as the characteriation of the differential efficacious responses to and side effects from the differential efficacious responses to and side effects from him secting on a disease as well as other treatment.

N. B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3056, 3157, 3237, 3297 and 3367, are not actually given a sequence in the Sequence Listing from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ7440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel biallelic markers used to construct a high density disequilibrium map of the human genome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human biallelic marker downstream amplification primer SEQ ID NO:10187.
                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human genome, biallelic marker; high density disequilibrium map; genomic map; haplotype; phenotype; polymorphic base; genotyphing; haplotyping; hybridisation; identification; characterisation; amplification; single nucleotide polymorphism; SNP; PCR primer;

The present invention describes an anti-CD14 antibody, which has a function of inhibiting the binding of CD14 to the Toll-like receptor (TLR). The anti-CD14 antibody can specifically recognise the epitope containing the domain from numbers 269-315 in human CD14 of the sequence in AAG68127 or a part of it. Anti-CD14 antibody has antibacterial, haemosepaive, antipyretic, hypertensive, immunostimulant, haemostatic and vasotropic activities. The antibody together with other polypeptides are applicable in drugs for treating bacterial infection as well as sepsis, fever, hypotension, leukopenia, thrombosenia, shock and multi-organ failure. AAG68127 to AAG68137 and AAI71230 to AAI71295 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Anti-CD14 antibody or its fragment inhibiting the binding of CD14 to Toll -like receptor, applicable in drugs for treating bacterial infection as well as sepsis, fever, hypotension, leukopenia, thrombopenia and shock.
                                                                                                                                                                                                                                                                                                                                                           TLR/CD14 binding inhibitor; antibacterial; immunosuppressive; antippretic; hypertensive; immunostimulant; haemostatic; vasotropic; bacterial infection; sepsis; fever; hypotension; leukopaenia; thrombopaenia; shock; multi-organ failure; ss.
                                                                                                                                                                                                                                                                                                                                receptor; TLR; CD14; antibody; anti-CD14 antibody;

The present sequence was used to demonstrate the ability of deoxynucleic 5-Methythiourea (DNMT) compounds to form triplexes with DNA oligomers. An increase in the Content of the oligos resulted in a large decrease in binding. This experiment was performed as an example of a method for preparing oligomucleotides comprising a backbone of alkyl or alkoxy thiourea linkages. The method is useful for preparing oligomucleotides for use in antisense or antigene herapy, to inhibit production of proteins associated with genetic diseases, cardiovacular, inflammatory of monurcellular diseases, and for antiviral therapy, e.g. to treat thuman immunodeficiency virus, human-cytomegalovirus, influenza and herpes infections. The compounds are also useful as diagnostic reagence to detect the presence or absence of the target DNA or RNA sequences to which they specifically bind and by antagonising the normal biological activity of a target protein, they can be used in the manipulation of tissue e.g. tissue differentiation, both in vivo and in ex vivo tissue cultures. The method provides an efficient and rapid solid-phase method for the synthesis of thiourea and S-methylthiourea
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                         This invention describes a novel recognition system comprising at least 1 recognition unit bound to a support, each recognition unit comprising a region A with a defined structure adjacent to a region B with a randomized structure. The recognition system is useful for screening, identifying, or characterizing at least 1 component of a sample, especially nucleic acids and/or proteins, and for screening for and/or identifying cellular or synthetic binding partners, preferably proteins, peptides, nucleic acids, chemical agents, preferably organic compounds, pharmaceuticals, plant protection agents, toxins, venoms, carcinogens, teratogens, herbicides, fungicides or pesticides
                                                                                                                                                  Recognition system, e.g. for identifying nucleic acids, comprises at least one recognition unit comprising a region with a defined structure adjacent to a region with a randomized structure.
                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                   ö

The present sequence is an oligonucleotide provided in a specification relating to the simplified purification of oligonucleotides by liquid chromatography. The process comprises: (a) pouring oligonucleotides by liquid chromatography column packed with an optective group into a liquid chromatography column packed with an optective cresistant packing agent, such as polystyrene resin; (b) pouring a mixed developing solvent composed of a buffer made from a volatile salt and a water soluble organic solvent at a suitable concentration gradient into the column; (c) pouring an aixed from a volatilarly c.0.16 v/# acetic acid, into the column to deprotect the oligonucleotides protected with the hydroghobic group; (d) pouring a mixed developing solvent composed of a buffer made from a volatile salt, particularly 0.05-0.5 N aqueous ammonium hydrogencarbonate solution adjusted at pH 8-10, and a water soluble organic solvent at a suitable concentration gradient to elute the deprotected oligonucleotides; and (e) removal of the solvent and the salt
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Microbial production of caphalosporin C or its derivatives, useful as intermediates for antibiotics, in cells transformed with a gene encoding CPC (cephalosporin C)-acetylhydrolase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cephalosporin C-acetyl hydrolase; CPC-AH; cephalosporin C; CPC; primer; cahB; 7-aminocephalosporanic acid; ss; PCR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to production of Acremonium chrysogenum cephalosporin C-acetyl hydrolase (CPC-AH) and its utilisation in the synthesis of deacetylated derivatives of cephalosporin C (CPC) and the inactivation of the gene for increasing production of cephalosporin. Derivatives and/or their synthesis intermediates can be synthesised by growing a microbial host transformed with a DNA sequence that includes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Velasco Alvarez J, Gutierrez Martin S, Casqueiro Blanco FJ;

The present sequence is that of oligonucleotide AGT02025, which contains a single mismatch with a target DNA oligonucleotide (see ABA91531). It is one of a set of oligonucleotides (see ABA91532-37) containing mismatch(se) to the target DNA that were tested in a hybridisation/RNase H cleavage assay. The results showed that 2 mismatches between the target and the probe ablated RNase H cleavage. The effect of one mismatch site was less than that of two mismatch sites, and showed a polarity effect, with weaker inhibition shown in assays with AGT02021 than in assays using an oligonucleotide in which the mismatch was at an adjacent position. Oligonucleotides in which the mismatch was go or Crather than A showed similar inhibition of RNase H cleavage. The invention provides probes for nucleic acid hybridisation. The probes form a hairpin structure
the cahB gene encoding A. chrysogenum CPC-AH, under conditions where it is either expressed or inactivated. The genes and proteins are used for removal of acetyl groups, especially from the 3'-carbon of CPC or from 7-aminocephalosporanic acid, to give deacetylated products useful as intermediates for cephalosporin antiblotics. Inactivation of the gene that expresses CPC increases production of cephalosporins by A. chrysogenum. This sequence represents a PCR primer used to clone the cahB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             that forms hairpin structure having a double-stranded segment and single-
stranded loop collectively forming region complementary to target

comprising a double-stranded stem and a single-stranded loop, and are capable of both intramolecular and intermolecular hybridisation. The double-stranded stem may comprise a methylphosphonate DNA:RNA hybrid that is resistant to RNase H cleavage. When the probe hybridises with a target DNA, the RNA strand in the DNA:RNA duplex becomes sensitive to RNase H treatment and can be removed. Arrays and methods for nucleic acid hybridisation using the probes are provided
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an anti-CD14 antibody which can specifically recognise an epitope containing a part of a domain with not less than 8 amino acids in human CD14 in the region from positions 269-315 in a fully defined sequence of 356 amino acids as given in the specification. The antibody is useful in drug compositions for treating sepsis and for screening remedies for sepsis. This polynucleotide sequence represents anti-CD14 related oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Anti-CD14 monoclonal antibody which inhibits CD14/T lymphocyte receptor binding by specifically recognizing epitope in human CD14 domain to prevent interaction and suppress cell activation, useful for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Immunosuppressive; antibacterial; anti-CD14 antibody; epitope; sepsis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

```
The present invention relates to antisense oligonucleotides and methods for modulating the expression of human or mouse casein kinase 2-alpha prime. The antisense oligonucleotides are useful for inhibiting the expression of casein kinase 2-alpha prime. Such diseases with aberrant expression of casein kinase 2-alpha prime. Such diseases include diabetes mellitus, and hyperproliferative disorders (particularly cancers e.g. breast cancer, prostate cancer, or liver cancer). The antisense compounds are also useful for diagnostics, therapeutics, prophylaxis, e.g. to prevent or delay infection, inflammation or tumnour formation, as research reagents and kits, and in distinguishing between functions of various members of a biological pathway. ABS67940-ABS67917 represent human or mouse casein kinase 2-alpha prime antisense oligonucleotides which comprise a phosphorothioate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New antisense oligonucleotides targeted to nucleic acid encoding casein kinase 2-alpha prime, useful for diagnosing and/or treating a disease or condition associated with expression of casein kinase 2-alpha prime.
                                                                                                                                                                                         Human, casein kinase 2-alpha prime; diabetes mellitus; hyperproliferative disorder; breast cancer; prostate cancer; liver cancer; inflection; inflammation; tumour formation; cytostatic; antidiabetic; antiinflammatory; antimicrobial; phosphorothioate;
                                                                                                                                                      Human casein kinase 2-alpha prime antisense oligonucleotide #14.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0.9%; Score 15.2; DB 1; Length 20;

The present invention relates to a method for the synthesis of a polynucleotide which involves coupling a second nucleoside to a first nucleoside through a phosphite linkage, where the second nucleoside has a non-carbonate protecting group protecting a hydroxyl, and exposing the product to a composition which concurrently oxidizes the phosphite formed to a phosphate and deprotects the protected hydroxyl of the second nucleoside. The method is useful for synthesizing the polynucleotides, for carrying out either 3' to 5' or 5' to 3' synthesis and for fabricating an addressable array of polynucleotides on a substrate. The present sequence is an oligonucleotide produced to demonstrate the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

                                                                                                                                                                                                                                                                                                                                                                                                                                Homo sapiens.
                                                                                                                               17-OCT-2003
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      31-OCT-2002.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ubiquinone.
                                                                             ABZ87221;
ABZ87221/
                                                    The invention relates to nucleic acids encoding a variety of proteins human T139 (TANGO-139), T125 (TANGO-125), T110 (TANGO-110), murine T175 (TANGO-125), human T139 (TANGO-139), T125 (TANGO-125), T110 (TANGO-110), murine T175 (TANGO-125), human T135 or murine WDNM-2, having diagnostic, preventive, therapeutic and other uses. Polypeptide of the invention has the ability to modulate cell-cell interactions, hematopoiesis and the ability to modulate clotting. Polypeptide and polynucleotide of the invention are useful for diagnosing and treating disorder characterised by their aberrant expression or activity. The artibodies are useful as modulating agents in regulating a variety of cellular processes e.g. cell proliferation and/or cell differentiation. TANGO-139 is useful for treating neoplasia, TANGO-130 is useful for treating cancer, are useful to treat pancreatic discase, and tumours, and injury or trauma to the brain TANGO-125, 110, 175 molecules treat heart discase, e.g., ischaemic cheart disease, cardiovascular discases (e.g., acute and chronic glomerulonephritis), TANGO-135 molecules are useful to treat chieving profers, hyperplasia of the endometrium. TANGO-110 is useful to treat uterine disorders, hyperplasia of the endometrium. TANGO-110 is useful for treat uterine and thumours. TANGO-139, 125, 110, 175 or WDNM-2 are useful for treating proliferation disorders, under a single disorders, such as inflammatory diseases Crohn's cheared proliferation disorders, inflammatory diseases Crohn's cheared proliferation disorders, inflammatory diseases and tumours discase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WDNM-2 activity also include apoptotic disorders, rheumatoid arthritis, systemic lupus erythematosus, insulin-dependent diabetes mellitus, immune-related disorders, e.g., immunodeficiency disorders, viral disorders, c., cancers and inflammatory disorders and apoptotic disorders. The nucleic acids of the invention are used in gene therapy. The present sequence is a PCR primer used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel TANGO polypeptides and nucleic acid molecules useful as modulating agents in regulating cellular processes and for diagnosing and treating heart, liver, lung, kidney, inflammatory and cellular proliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 20 BP; 2 A; 9 C; 5 G; 4 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Mccarthy SA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                           The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genemic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or

WPI; 2003-229219/22.

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone.

Disclosure; SEQ ID NO 4728; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding regalon, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dystunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiathmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antisense gene therapy. The composition is useful for treating or preventing sensitivity to adenosine, reducing levels of or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ung unflammation, lung allergies, or a respiratory disease or condition, or the sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences

ubiquinone.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation coodon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2.10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entile flammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiathment, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ung surfactant in a subject's tissue, or treating bronchoconstriction, lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from MIPO at ftp.wipo.int/pub/published\_pct\_sequences

Pabalan J, Aguilar D; Katz E, Li Y, Sandrasagra A, K Tang L, Shahabuddin S; Miller S, Nyce JW,

WPI; 2003-229219/22

Pharmaceutical composition for treating ailments associated with impaired ö respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid ubiquinone.

Claim 15; SEQ ID NO 910; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' interon-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or masal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an artiinflammatory steroid in a subject, for reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO ftp.wipo.int/pub/published\_pct\_sequences

ubiquinone

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the intitation coodon, coding regains, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiathmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an entistic manner or steroid in a subject, for reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition. Disclosure; SEQ ID NO 4023; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the intitation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an natiniflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallargic, antiathmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing sensitivity to adenosine, reducing sensitivity to adenosine, reducing sensitivity to adenosine, reducing sensitivity to adenosine, reducing bronchodilation, increasing bronchoconstriction, lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences

Pharmaceutical composition for treating ailments associated with impaired 占 respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid

Disclosure; SEQ ID NO 5167; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' interon-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or masal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallargic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition may have a use in antisense gene therapy. The composition may have a use in antisense yet repropriatory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an artifinflammatory steroid in a subject, for reducing levels of or reducing sensitivity to adenosine, reducing levels of dependinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences

```
The present sequence is that of antisense oligonucleotide ISIS #114628. This chimeric phosphorothloate oligonucleotide, having 2'-MOE wings and a deoxy gap, is trageted to the 5' untranslated region of human Toll-like receptor 4 mRNA. It exhibits 32% inhibition of human Toll-like receptor 4 and THP-1 cells. It is useful for inhibiting the expression of Toll-like receptor 4 in cells or tissues. The oligonucleotide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Thl or Th2 responses
                                                                                                                 Human; Toll-like receptor 4; receptor; antiinflammatory; immunomodulator;
phosphorothioate; antisense; 88.
                                                                                                                                                                                                                             "Mod_base= OTHER
/note= "OTHER = phosphorothioate nucleotides, the oligonucleotide comprises a central gap region of 10 2'-deoxymucleotides flanked on both sites by 5-nucleotides wings composed of 2'-methoxyethyl nucleotides"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New antisense oligonucleotides for modulating Toll-like receptor 4.gene expression, particularly useful for preventing, delaying or treating e.g. inflammatory disorders, or conditions involving Th1 or Th2 immune
                                                                                    Human Toll-like receptor 4 antisense oligonucleotide ISIS #114628
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 20 BP; 3 A; 4 C; 10 G; 3 T; 0 U; 0 Other;

Determining bcr-abl translocation rearrangements in a biological sample, useful for diagnosing chronic myeloid leukemia or acute lymphoblastic leukemia, comprises performing real time polymerase chain reaction on the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method of determining bcr-abl translocation rearrangements (the Philadelphia chromosome) in a biological sample, which comprises reverse transcribing extracted RNA from the sample to CDNA and performing polymerase chan reaction (PCR) on the CDNA, Also included is a method of diagnosing chronic myeloid leukaemia (CML) or acute lymphoblastic leukaemia (ALL) by performing the assay cited above. The method is useful in assaying biological samples for bcr-abl translocation rearrangements and reporting the results of such assays useful in the diagnosis of CML and/or ALL. The present sequence represents the human bcr-abl gene rearrangement assay primer BCR-P2, P3F
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

erythropoietin gene with single nucleotide polymorphisms, for diagnosing, preventing and treating cancers, infections and autoimmune diseases. Novel polypeptide encoded by nucleotide sequence derived from human

Example 2; Page 74; 76pp; English.

derived from human erythopoletin gene (BPO) with single nucleotide gequences of the invention are useful for preventing or treating diseases such as cancers and tumours which include metalanomas, metalating diseases such as cancers and tumours which include metalanomas, metalating renal carcinomas, leukaemias such as follicular lymphomas cancers of the liver, neck, head and cutaneous T cell lymphoma, leukaemia, cancers of the liver, neck, head and kidneys, multiple myelomas, cancers of the liver, neck, head and kidneys, multiple myelomas, carcinoid tumours and tumours that appear following an immune deficiency comprising Kaposi's sarcoma in the case of following an immune deficiency comprising Kaposi's sarcoma in the case of following an immune deficiency comprising kaposi's sarcoma in the case of following an immune deficiency survail infections including chronic hepatitis B and C and human immunodeficiency virus (HIV)/acquired immune deficiency syndrome (AIDS) and infectious pneumonias; venereal diseases of deficiency syndrome (AIDS) and infectious pneumonias; venereal diseases of alseases and diseases and ulcerative colitis; cardiovascular diseases such as allergies, asthma, psoriasis, rheumaterid arthritis, multiple solerosis, cronn's diseases and ulcerative colitis; cardiovascular diseases such as well as anaemia resulting from chronic control infections, inflammatory processes, radiocherapies and chemotherapies; chears in control and control metabolic diseases such as more immune associated diseases such as metabolic diseases such as more immune associated diseases. obesity, central nervous system diseases including Alzheimer's disease, Parkinson's disease, schizophrenia and depression. gastrointestinal disorders and disorders connected with chemotherapy treatments. The present sequence is human BPO gene fragment amplifying PCR primer The invention relates to polypeptides encoded by nucleotide sequences

```
The invention relates to a novel method for detecting a point mutation in a DNA strand. The novel method comprises hybridising a target DNA strand containing or suspected of containing a point mutation with a test nucleic acid strand duplex, contacting the duplex with an strand/test nucleic acid strand duplex, contacting the duplex with an nucleotide sequence are cleaved by Rwase H. The method is useful for detecting a point mutation in a DNA strand, where the point mutation to be detected is a single nucleotide polymorphism, preferably a polymorphism in a genome, e.g., a viral, bacterial, eukaryotic, mammalian or human genome. The method is useful to detect any nucleic acids from any species of organisms such as Acintobacter, Bacillus, Candida, Enterococcus, Haemophilus, Mycobacterium and Streptococcus, and viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Detecting point mutation in DNA strand, by hybridizing target DNA strand having mutation with test DNA strand to form duplex, contacting the duplex with RNase H and determining the cleavage of test strand by RNase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This polynucleotide sequence represents a ribonucleotide relating to the mutation detecting method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

New TANGO polypeptides useful as modulating agents in regulating cellular processes and for diagnosing, treating heart, liver, lung, kidney, inflammatory and cellular proliferative disorders.

Disclosure; Page 65; Opp; English.

The invention relates to an isolated polypeptide termed human T139 (TANGO - 139), T125, T110, murine T175, human T175 or murine MDNM-2. T139 is useful for treating kidny defects such as kidney failure or hyperplasia, useful for treating wound healing and cancer, T110 is useful for treating monopolate. T125 is useful for treating and cancer, T110 is useful for treating cancer, inflammatory disorders and nemacopolatic disorders. T125 and 110 are useful to treat pancreatic disorders such as pancreatitis, diabetes mellitus, and Zollinger-Ellison syntome, placental disorders such as placentitis or abortion and syntome, placental disorders such as placentitis or abortion and clisorders of the brain such as crebral edema, cerebrovagular disease and tumours and injury or trauma to the brain. T125, 110, 175 molecules treat heart disorders e.g., ischaemic heart disease, atherosoclerosis, chypertension, angina pectoris, pulmonary (lung) disorders such as treumatoid lung disease, bronchial asthma and Goodpasture's syndrome, disorders of skeletal muscale such as muscular dystrophy, motor neuron disorders e.g., amyotrophic lateral sclerosis, cardiovascular disorders such as theumatic heart disease or myocardial disease, hepatic disorders including jaundice, hepatic failure, Crigler-Naijar syndromes or anignant tumours. T139, 125, 110 and 175 molecules are useful to treat crenic glomerulonephritis) and reproductive disorders and sperm cell crenic glomerulonephritis) and reproductive disorders and sperm cell disorders. T175 is useful to treat uterine disorders and sperm cell caseociated diseases and disorders, hyperplasia of the endometrium, uterine cancer, bonne marrow, blood and haematopoietic sansociated diseases and disorders, e.g., acute myelulia, ansamia and thalassaemia. T-110 is useful to treat spleen e.g., the foetal spleen associated diseases and disorders such as sincetive connecoplastic cysts and tumours, intestinal disorders such as inflammatory diseases.

Connecoplastic cysts and tumours, intestinal disease, colo

target nucleic acid molecule.

WPI; 2003-803888/75.

The invention comprises a method for detecting a target nucleic acid molecule in a plurality of templates, the method involves combining a detection probe, a first oligonucleotide, second oligonucleotide, a primer and a plurality of templates suspected of containing the target nucleic acid molecule. The method of the invention is useful for detecting the presence of a target nucleic acid molecule in a plurality of templates. The method is also useful for quantitating a particular nucleic acid molecule in a sample. The invention provides a rapid, reliable and cost-effective method for detecting a particular nucleic

such as congenital anomalies and tumours. T139, 125, 110, 175 or WDNM-2 are useful for treating proliferative disorders, inflammatory disorders e.g., bacterial infection, psoriasis, e.g., ulcerative colitis, arthritis and allergic inflammatory disorders (e.g., asthma, psoriasis). The invention is useful in gene therapy. The present sequence is human TANGO CDNA related PCR primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           nucleic acid detection; nucleic acid quantitation; universal sequence;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       셤
```

```
AAQ79182-Q79186 contain one or more 9-methyl-acyclo-adenosines, acylic nucleoside analogues which inhibit nuclease degradation. The nuclease resistant oligonucleotides can themselves be used to inhibit gene expression as antiense agente, in nucleic acid sequencing and diagnostic assays. (Updated on 25-WAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Enzymatic nucleic acid, ribozyme; trans cleavage; inhibition, gene expression; downregulation; interleukin-5; IL-5; ICAM-1; intercellular adhesion molecule; rel A; tumour necrosis factor; TNF-alpha; respiratory syncytial virus; RSV; bcr-abl; oncogene; translocation; chronic myelogenous leukaemia; CML; cancer; Philadelphia chromosome; inflammation; autoimmune disease; atherosclerosis; myocardial infarction; stroke; restenosis; transplant rejection; rheumatoid arthritis; psoriasis; myocardial; Kawasaki disease; septic shock; HIV; human immunodeficiency virus; acquired immune deficiency syndrome; AIDS;
                                                                                                                                                                                                                                                                                                                                                                       New acyclic nucleoside analogues - used to prepare nuclease resistant oligo-nucleotide(s) used partic. for inhibiting gene expression.

28-NOV-1994;
The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves ICAM-1 mRNA at the uncleotide base position indicated in the DE line. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes cleave the ICAM-1 target sequences and thereby inhibit ICAM-1 expression, making them useful for reducing transplant sejection and alleviating symptoms in patients with rheumatoid arthritis, asthma and other inflammatory disorders. that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes cleave the ICAM-1 target sequences and thereby inhibit ICAM-1 expression, making them useful for reducing transplant rejection and alleviating symptoms in patients with rheumatoid arthritis, asthma and other inflammatory disorders. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Oligonucleotide containing phosphoramidate linkages.

BP

A new method is provided for the synthesis of oligonucleotides having N3'->P5' phosphoramidate linkages. The method comprises (a) attaching a 3'-protected amino nucleoside to a solid support; (b) deprotecting the 3'-amino; (c) reacting with a 3'-protected aminouncleoside-5'-phosphoramidite monomer to form an internucleoside N3'->P5' phosphoramidite link; (d) oxidising this link to phosphoramidate; and optionally repeating steps (b)-(d) until the required oligonucleotide is completed. This method provides better yields with lower reagent consumption than known processes, and can be operated on a large scale. Synthesis of N3' to P5' phosphoramidate oligo:nucleotide - by reacting immobilised 3'-amino nucleotide with new amino:nucleoside 5'-phosphoramidite then oxidation, useful as research, diagnostic and /\*tag= a /note= "these residues have N3′->P5′ phosphoramidate linkages" Nelson JS; SN, phosphoramidate linkage; solid phase synthesis; ss. ö
The obtained oligos, containing phosphoramidate linkages, have favourable binding properties, nuclease resistance and solubility, and are useful as research, diagnostic and therapeutic agents. The present sequence is an example of an oligonucleotide in which N3'->P5' phosphoramidate linkages have been introduced by the new method. (Updated on 25-WAR-2003 to

The obtained oligos, containing phosphoramidate linkages, have favourable binding properties, nuclease resistence and solubility, and are useful as research, diagnostic and therapeutic agents. The present sequence is an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A new method is provided for the synthesis of oligonucleotides having N3' ->PS' phosphoramidate linkages. The method comprises (a) attaching a 3'-protected amino nucleoside to a solid support; (b) deprotecting the 3'-amino; (c) reacting with a 3'-protected aminouncleoside-5'-phosphoramidite monomer to form an internucleoside N3'->PS'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Synthesis of N3' to P5' phosphoramidate oligo:nucleotide - by reacting immobilised 3'-amino nucleotide with new amino:nucleoside 5'-phosphoramidite then oxidation, useful as research, diagnostic and therapeutic agents.
                                                                                                                                                                                            Gaps

New release tag compounds for detecting target molecule(s) - comprising a reactive group, a release group and a releasable non-volatile mass label detectable by mass spectrometry.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The sequence is that of an oligonucleotide primer which was produced as part of an oligonucleotide peptide conjugate as an example of a release tag compound (RTC). These comprise a reactive group, a release group and a non-volatile mass label comprising a synthetic polymer or biopolymer detectable by mass spectrometry. The RTGs can be used as probes for the sequences, identification of non-coding nucleotide sequences, identification of non-coding nucleotide sequence, identification of mutations within a gene or protein sequence, detection of metals, detection of receptors on an organism or a cell, characterisation of antibody-antigen interactions, enzymesubstrate interactions and characterisation of ligand interactions. Multiplex applications include multiple pathogen diagnostics, multigene genetic polymorphism screening, single nucleotide polymorphism (SNP)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            genotyping, clone and gene mapping, and gene expression analysis. The RTCs permit the ready detection of releasable mass labels by mass spectroscopy. The releasable mass labels permit the multiplexing of tens, hundreds and perhaps even thousands of different mass labels that can be used to uniquely identify each desired target
example of an oligonucleotide in which N3'->P5' phosphoramidate linkages have been introduced by the new method. (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          oligonucleotide; peptide; conjugate; release tag compound; mass spectrometry; detection; identification; diagnosis; primer; ss.

This sequence represents an oligonucleotide receptor molecule covalently bound to a polyacrylamide gel via a linking group. The invention relates to selective separation of electrically charged target molecules in an analytical mixture. It comprises capillary affinity gel electrophoresis using a capillary tube which is at least partly filled with a polymer. C gel. Receptors for target molecules are covalently bound to the polymer. C gel. Receptors for target molecules are covalently bound to the polymer. C an electric field of at least 50 volte/C m is applied. The capillary tube is charged with the analytical mixture. In a first separation stage, the target molecules in the mixture are bound to the receptors and the c second stage, the elution conditions are changed, optionally in stages, conditions are changed, optionally in stages, conditions and of the target molecules for the receptor is contact the affinity of the target molecules for the receptor is climinated and the target molecules are eluted and detected, optionally whilst splitting open. The process is useful for selective separation and/or determination of charged organic compounds, such as oligonucleotides, peptides or carbohydrates. It may be used, e.g. for isolation of specific proteins and DNA molecules, purification of specific proteins and DNA molecules, purification of specific proteins and DNA molecules, purification of papering or antibodies, analysis of antisense compounds or screening for enzyme inhibitors. The process especially in the case of complex mixtures. It has high sensitivity, even with small amounts of samples. The derivatised polymers may be synthesised specifically using candard methods

The invention relates to selective separation of electrically charged target molecules in an analytical mixture. It comprises capillary affinity gel electrophoresis using a capillary tube which is at least partly filled with a polymer gel. Receptors for target molecules are covalently bound to the polymer. An electric field of at least 50 volts/m is applied. The capillary tube is charged with the analytical mixture. In a first capillary tube is charged with the analytical mixture are bound to the receptors and the remaining components are eluted, optionally whilst splitting open. In a second stage, the elution conditions are changed, optionally in stages, so that the affinity of the target molecules for the receptor is eliminated and the target molecules are eluted and detected, optionally whilst splitting open. The process is useful for selective separation and/or determination of charged organic compounds, such as oligonuclectides, peptides or carbohydrates. It may be used, e.g. for isolation of specific proteins and DNA molecules, purification of antibodies, analysis of antisense compounds or screening for enzyme thibitors. The processes, especially in the case of complex biological analytical mixtures. It has high sensitivity, even with small amounts of

The sequence is generated synthetically by using an amine-exchange reaction of phosphoramidites in which a deprotected 3'-amino group of an oligonucleotide chain is exchanged for the amino portion of a 5'-phosphoramidite with a protected 3' amino group. The resulting phosphoramidite internucleotide linkage is oxidised to form a stable protected phosphoramidate linkage
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New 3'-protected-amino-nucleoside-5'-phosphoramidite monomers - used in the synthesis of oligo-nucleotide(s).

In present sequence claims are presented raisers and enzymatic nucleic acid, especially a hammerhead riboxyme, which cleaves the Hepatitis C virus (HCV) RNA sequence in the 3' non-core region. The HV sequence was screened for optimal riboxyme target sites using a computer folding algorithm and regions of the mRNA which did not form secondary folding structures and contained potential riboxyme cleavage sites were identified. Riboxymes were synthesised to target these sites and their activities optimised by either varying the length of the binding arms or by modification to prevent degradation by nucleases. The riboxymes of the invention inhibit gene expression and/or viral replication, and are used to treat diseases associated with Hepatitis C virus (HCV) infection, e.g. cirrhosis, liver failure and hepatocellular carcinoma. The riboxymes may be used in combination with interferon to treat HCV infection, other infectious diseases, autoimmune diseases, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Enzymatic nucleic acid; hammerhead ribozyme; virus replication; cleavage; cirrhosis; liver failure; hepatocellular carcinoma; interferon; cancer; autoimmune disease; 88.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Enzymatic nucleic acid; hammerhead ribozyme; virus replication; cleavage; cirrhosis; liver failure; hepatocellular carcinoma; interferon; cancer; autoimmune disease; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents an example of an oligonucleotide containing novel 3. amino-5. phosphoramidite nucleoside of the invention. The sequence is generated synthetically by using an amine-exchange reaction of phosphoramidites in which a deprotected 3. amino group of an oligonucleotide chain is exchanged for the amino portion of a 5. phosphoramidite with a protected 3 amino group. The resulting phosphoramidite internucleotide linkage is oxidised to form a stable

enzymatic nucleic acid, respectably a hammerhood ribozyme, which cleaves the Hepatitis C virus (HCV) RNA sequence at the base position given in the descriptor line. The HCV sequence was screened for optimal ribozyme target sites using a computer folding algorithm and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised to target these sites and their activities optimised by either varying the length of the binding arms or by modification to prevent degradation by viral replication, and are used to treat diseases associated with Hepatics C virus (HCV) infection, e.g. cirrhosis, liver failure and hepatocellular carcinoma. The ribozymes may be used in combination with
                                                                                                                                                                                                                                                                                                                                                                                                                          interferon to treat HCV infection, other infectious diseases, autoimmune diseases, and cancer
                                                                                                                                         Novel ribozymes for the treatment of diseases and conditions related to hepatitis C infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New DNA encoding endo-beta-mannanase from coffee, used e.g. in pharmaceutical, cosmetic or food compositions to hydrolyze polymannans.
                                                                                                                                                                                                                       The present sequence represents the preferred target sequence of an

                                 PCR primers AAA46501-02 were used to amplify DNA encoding an endo-betamennase enzyme, which is involved in the hydrolysis of polysaccharides that consist of molecules of mannan, either simple or branched, linked together by beta (1-4) bonds. The mannanase polynucleotide sequence is used for in vivo modification of the coffee endo-beta-mannanase gene. It is also used to produce transgenic plant cells (especially coffee cells) which have modified properties of mannan polysaccharide, and thus altered flavour or structure. The enzyme is used for modification, degradation or synthesis of mannan polysaccharides in vitro, particularly to treat coffee beans to increase the percentage of dry matter extraction, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present primer was used to reverse transcribe human RNA, from which a

their pharmaceutically acceptable sales. The nucleomonomers are used as monomores in oligomers, which are used in pharmaceutical compositions to monomers in oligomers, which are used in pharmaceutical compositions to inhibit expression of nucleic acid molecules including DNA and RNA in calls such as bacterial, fungal, yeast, mammalian, cancer and virally-infected cells. They are used in oligomers for gene regulation, antisense technology, diagnostic applications to detect target sequences in biological samples such as those containing pathogenic bacteria, funging and viruses, oncogenes, growth hormones, serum proteins, adhesion molecules, receptor molecules, cytokines, oncogenes, growth factors and molecules, receptor molecules, cytokines, oncogenes, growth factors and infections associated with pathological conditions cancer, viral infections and bacterial infections (see AAA07786 for details of other uses for which the oligomers are suitable for). Oligomers comprising the nucleomonomers exhibit increased duplex DNA stability when hybridizing to target nucleic acid sequences, are physiologically stable, non-toxic and able to penetrate into cells while maintaining stringent base pair invention provides modified nucleomonomers of specified formula and 

The invention provides modificate inclearmonionmers of the invention provides and provides, oncogenes, growth hormones and enzymes, to target genes or and viruses, oncogenes, growth hormones and enzymes, to target genes or molecules, receptor molecules, receptor molecules, receptor molecules, receptor molecules, provines, oncogenes, growth factors and infections associated with pathological conditions such as inflammatory conditions, cardiovascular disorders, immune reactions, cancer, viral infections and bacterial infections (see AAAO,786 for details of other infections and bacterial infections (see AAAO,786 for details of other or proceed and processed duples DNA stability when hybridizing to be arget into each sequences, are physiologically stable, non-toxic and carge into cales while maintaining stringent base pair fidelity for target DNA sequences. The oligomers described by the form single- or double-stranded target nucleic acid binding activity to form

The invention provides modified nucleomonomers of specified formula and

their pharmaceutically acceptable salts. The nucleomonomers are used as monomers in oligomers, which are used in pharmaceutically acceptable salts. The nucleomonomers are used as monomers in oligomers, which are used in pharmaceutical compositions to inhibit expression of nucleic acid molecules including DNA and RNA in cells such as bacterial, fungal, yeast, mammalian, cancer and virally-infected cells. They are used in oligomers for gene regulation, antisense technology, diagnostic applications to detect target sequences in biological samples such as those containing pathogenic bacteria, funging and viruses, oncogenes, growth hormones, serum proteins, adhesion and viruses, oncogenes, growth hormones, serum proteins, adhesion molecules, receptor molecules, cytokines, oncogenes, growth factors and interleukins associated with pathological conditions such as inflammatory conditions, cardiovascular disorders, immune reactions, cancer, viral interteukins and bacterial infections (see AAAO7786 for details of other uses for which the oligomers are suitable for). Oligomers comprising to target nucleic acid sequences, are physiologically stable, non-toxic and able to penetrate into cells while maintaining stringent base pair fidelity for target DNA sequences. The oligomers demonstrate significant singles. Triplexes or other forms of table association. Sequences and uplasses, triplexes or other forms of stable association. Sequences invention provides modified nucleomonomers of specified formula and

The invention provides modified nucleomonomers of specified formula and their pharmaceutically acceptable salts. The nucleomonomers are used as monomers in oligomers, which are used in pharmaceutical compositions to inhibit expression of nucleic acid molecules including DNA and RNA in cells such as bacterial, fungal, yeast, mammalian, cancer and virally-infected cells. They are used in oligomers for gene regulation, antisense ceromology, diagnostic applications to detect target sequences in biological samples such as those containing pathogenic bacteria, fungi and viruses, oncogenes, growth hormones and enzymes, to target genes or encoded RNAs that encode enzymes, hormones, serum proteins, adhesion molecules, receptor molecules, cytokines, oncogenes, growth factors and interleukins associated with pathological conditions such as inflammatory conditions, cardiovascular disorders, immune reactions, cancer, viral infections and bacterial infections (sound bacterial infections (sound bacterial) the conditions included to be apply to target nucleic acid sequences, are physiologically stable, non-toxic and able to penetrate into cells while maintaining stringent base pair and allower or double stranded target nucleic acid sequences. The oligomers demonstrate significant and sequences in the oligomers demonstrate significant and sequences. The oligomers demonstrate significant and sequences. inplexes, triplexes or other forms of stable association. The invention provides modified nucleomonomers of specified formula and their pharmaceutically acceptable salts. The nucleomonomers are used as monomers in oligomers, which are used in pharmaceutical compositions to inhibit expression of nucleic acid molecules including DNA and RNA in cells such as bacterial, fungal, yeast, mammalian, cancer and virally-infected cells. They are used in oligomers for gene regulation, antisense technology, diagnostic applications to detect target sequences in biological samples such as those containing pathogenic bacteria, funging technology, diagnostic applications to detect target sequences in concoded RNAs that encode enzymes, hormones, serum proteins, adhesion molecules, prowth hormones and enzymes, to target genes or encoded RNAs that encode enzymes, hormones, serum proteins, adhesion molecules, receptor molecules, cytokines, oncogenes, growth factors and interleukins associated with pathological conditions such as inflammatory conditions, cardiovascular disorders; immune reactions, cancer, viral infections and bacterial infections (see AAA07786 for details of other uses for which the oligomers are suitable for). Oligomers comprising to target nucleic acid sequences, are physiologically stable, non-toxic and able to penetrate into cells while maintaining stringent base pair carriangle. The argued DNA sequences. The oligomers demonstrate significant single- or double-stranded target nucleic acid binding activity to form duplexes, triplexes or other forms of stable association. Sequences

their pharmaceutically acceptable matternations to be promised as monomers in oligomers, which are used in pharmaceutical compositions to inhibit expression of nucleic acid molecules including DNA and RNA in cells such as bacterial, fungal, yeast, mammalian, cancer and virally-infected cells. They are used in oligomers for gene regulation, antisense technology, diagnostic applications to detect target sequences in biological samples such as those containing pathogenic bacteria, fungiand viruses, oncogenes, growth hormones and enzymes, to target genes or molecules, receptor molecules, hormones, serum proteins, adhesion molecules, receptor molecules, cytokines, oncogenes, growth factors and interleukins associated with pathological conditions such as inflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 conditions, cardiovascular disorders, immune reactions, cancer, viral infections and bacterial infections (see AAA07786 for details of other uses for which the oligomers are suitable for). Oligomers comprising the nucleomonomers exhibit increased duplex DNA stability when hybridizing to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 et nucleic acid sequences, are physiologically stable, non-toxic and to penetrate into cells while maintaining stringent base pair lity for target DNA sequences. The oligomers demonstrate significant

The invention provides modified nucleomonomers of specified formula and their pharmaceutically acceptable salts. The nucleomonomers are used as monomers in oligomers, which are used in pharmaceutical compositions to inhibit expression of nucleic acid molecules including DNA and RNA in cells such as bacterial, fungal, yeast, mammalian, cancer and virally-infected cells. They are used in oligomers for gene regulation, antisense technology, diagnostic applications to detect target sequences in biological samples such as those containing pathogenic bacteria, funging and viruses, oncogenes, growth hormones and enzymes, to target genes or encoded RNAs that encode enzymes, hormones, serum proteins, adhesion molecules, receptor molecules, cytchines, oncogenes, gandhesion conditions, cardiovascular disorders, immune reactions, cancer, viral infections and bacterial infections (see AAAA07786 for details of other uncelecomonomers exhibit increased duplex NNA stability when hybridizing to nucleomonomers exhibit increased duplex NNA stability when hybridizing to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         target nucleic acid sequences, are physiologically stable, non-toxic and able to penetrate into calls while maintaining stringent base pair fidelity for target DNA sequences. The oligomers demonstrate significant single- or double-stranded target nucleic acid binding activity to form

Nucleomonomer; cancer; gene regulation; antisense technology; leukemia; viral infection; inflammatory response; cellular proliferation; psoriasis; duplex; triplex; ss. Nucleic acid sequence of a strand of triplex oligomer 16 Disclosure; Page 30; 42pp; English. 99WO-US019029 98US-0097712P 23-JUN-2000 (first entry) (UYNE-) UNIV NEBRASKA WPI; 2000-246530/21 WO200011013-A1. 22-AUG-1998; 20-AUG-1999; 02-MAR-2000. Synthetic.

Modified nucleomonomers, used in physiologically stable, non-toxicoligomers used to inhibit expression of nucleic acids and in gene regulation, antisense technology and diagnostics.

Disclosure; Page 20; 42pp; English

The invention provides modified nucleomonomers of specified formula and their pharmaceutically acceptable salts. The nucleomonomers are used as monomers in oligomers, which are used in pharmaceutical compositions to inhibit expression of nucleic acid molecules including DNA and RNA in cells such as bacterial, fungal, yeast, mammalian, cancer and virally-infected cells. They are used in oligomers for gene regulation, antisense technology, diagnostic applications to detect target sequences in biological samples such as those containing pathogenic bacteria, funging an viruses, oncogenes, growth hormones and enzymes, to target genes or encoded RNAs that encode enzymes, hormones, serum proteins, adhesion molecules, receptor molecules, octokines, oncogenes, growth factors and intectleukins associated with pathological conditions such as inflammatory conditions and bacterial infections (see AAA07786 for details of other uses for which the oligomers are suitable for). Oligomers comprising the target nuclear acid sequences, are physiologically stable, non-toxic and target nuclear acid sequences, are physiologically stable, non-toxic and target into cells while maintaining stringent base pair files the pathology. fidelity for target DNA sequences. The oligomers demonstrate significant single- or double-stranded target nucleic acid binding activity to form duplexes, triplexes or other forms of stable association. Sequences AAA07820-834 represent sequences forming triplex oligomers

```

The invention provides modified nucleomonomers of specified formula and their pharmaceutically acceptable salts. The nucleomonomers are used as monomers in oligomers, which are used in pharmaceutical compositions to inhibit expression of nucleic acid molecules including DNA and RNA in cells such as bacterial, fungal, yeast, mammalian, cancer and virally-colls amples such as those containing pathogenic bacteria, funging technology, diagnostic applications to detect target sequences in biological samples such as those containing pathogenic bacteria, funging and viruses, oncogenes, growth hormones and enzymes, to target genes or encoded RNAs that encode enzymes, hormones, serum proteins, adhesion molecules, receptor molecules, conceptions and pathological conditions such as inflammatory conditions, cancer, viral infections and bacterial infections (see AAA07786 for details of other uses for which the oligomers are suitable for). Oligomers comprising the uncleic acid sequences, are physiologically stable, non-toxic and able to penetrate into cells while maintaining stringer base pair fidelity for target DNA sequences. The oligomers demonstrate significant single- or double-stranded target nucleic acid binding activity to form the angles of the collipomers forms of stable association. Sequences and allong with the collipomers or other forms of stable association.

Modified nucleomonomers, used in physiologically stable, non-toxic oligomers used to inhibit expression of nucleic acids and in gene regulation, antisense technology and diagnostics.

The invention provides modified nucleomonomers of specified formula and their pharmaceutically acceptable salts. The nucleomonomers are used as monomers in oligomers, which are used in pharmaceutical compositions to inhibit expression of nucleic acid molecules including DNA and RNA in cells such as bacterial, fungal, yeast, mammalian, cancer and virally-infected cells. They are used in oligomers for gene regulation, antisense technology, diagnostic applications to detect target sequences in the cechnology, diagnostic applications to detect target sequences in biological samples such as those containing pathogenic bacteria, funging anythuses, oncogenes, growth hormones and enzymes, to target genes or encoded RNAs that encode enzymes, hormones, serum proteins, adhesion molecules, receptor molecules, cytokines, oncogenes, growth factors and molecules, raceptor molecules, cytokines, oncogenes, growth factors and conditions, cardiovascular disorders, immune reactions, cancer, viral infections and bacterial infections (seee AAA07786 for details of other uses for which the oligomers are suitable for). Oligomers comprising to target nucleic acid sequences are physiologically stable, non-toxic and able to penetrate into cells while maintaining stringent base pair fidelity for target by a sequences. The oligomers demonstrate singlicant single- or double-stranded target nucleic acid binding activity to form the dunlar seament oligonucleotides forming a third strand along with the dunlar seament oligonucleotides forming a third strand along with
                                                                                                                                                                       Modified nucleomonomers, used in physiologically stable, non-toxic oligomers used to inhibit expression of nucleic acids and in gene regulation, antisense technology and diagnostics.

(UYNE-) UNIV NEBRASKA

The invention provides modified nucleomonomers of specified formula and their pharmaceutically acceptable salts. The nucleomonomers are used as monomers in oligomers, which are used in pharmaceutical compositions to inhibit expression of nucleic acid molecules including DNA and RNA in cells such as bacterial, fungal, yeast, mammalian, cancer and virallycificated cells. They are used in oligomers for gene regulation, antisense technology, diagnostic applications to detect target sequences in biological samples such as those containing pathogenic bacteria, funging and viruses, oncogenes, growth hormones and enzymes, to target genes or encoded RNAs that encode enzymes, hormones, serum proteins, adhesion concecules, receptor molecules, cytokines, oncogenes, growth factors and interleukins associated with pathological conditions such as inflammatory conditions, carcial vascular disorders, immune reactions, cancer, viral infections and bacterial infections (see AAA07786 for details of other uses for which the oligomers are suitable for). Oligomers comprising to target nucleic acid sequences, are physiologically stable, non-toxic and able to penetrate into cells while maintaining stringent base pair conditions target DNA sequences. The oligomers demonstrate significant single or deuble-stranded target nucleic acid binding activity to form duplaces, triplexes or other forms of stable association. Sequences

```
The present sequence is an oligonucleotide containing 3'-C-amino-5'(R)-C'3'-N'-ethanothymidine, a bicyclic-sugar nucleoside. All nucleotides in the sequence were incorporated by phosphoramidite chemistry using a DNA synthesiser. Bicyclic sugar nucleosides are conformationally restricted 3',5'-bridged nucleosides which can be used as building blocks for oligonucleotides on legonucleotides can be produced that have certain, desired, geometrical shapes and entropy advantages. They may have superior hybridisation to DNA and RNA, and excellent biological as antisense inhibitors of gene expression or as gene probes, and may therefore be used in antisense therapeutics or gene-specific diagnostics
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New conformationally restricted 3',5'-bridged nucleosides and oligonucleotides useful as antisense therapeutics or as gene-specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Oligonucleotide #4 containing 3'-C-amino-5'(R)-C,3'-N-ethanothymidine.

                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is an oligonuclectide containing 3'-C-amino-5'(S)-C'3'-N-ethanothymidine, a bicyclic-sugar nucleoside. All nucleotides in the sequence were incorporated by phosphoramidite chemistry using a DNA synthesiser. Bicyclic sugar nucleosides are conformationally restricted 3',5'-bridged nucleosides which can be used as building blocks for oligonucleotides. Oligonucleotides can be produced that have certain, desired, geometrical shapes and entropy advantages. They may have superior hybridisation to DNA and RNA, and excellent biological as antisense inhibitors of gene expression or as gene probes, and may therefore be used in antisense therapeutics or gene-specific diagnostics
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Oligonucleotide #3 containing 3'-C-amino-5'(R)-C,3'-N-ethanothymidine.

                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is an oligonucleotide containing 3'-C-amino-5'(R)-C,3'-N-ethanothymidine, a bicyclic-sugar nucleoside. All nucleotides in the sequence were incorporated by phosphoramidite chemistry using a DNA synthesiser. Bicyclic sugar nucleosides are conformationally restricted 3',5'-bridged nucleosides which can be used as building blocks for oligonucleotides. Oligonucleotides can be produced that have certain, desired, geometrical shapes and entropy advantages. They may have superior hybridisation to DNA and RNA, and excellent biological stability. The conformationally-modified oligonucleotides may be useful as ancisense inhibitors of gene expression or as gene probes, and may therefore be used in antisense therapeutics or gene-specific diagnostics
                                                                                                                                                                                                                                                                                                                                                 New conformationally restricted 3',5'-bridged nucleosides and oligonucleotides useful as antisense therapeutics or as gene-specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention relates to hybridisation probes which target a specific sequence within a large double-helical nucleic acid. The probe is complementary to the target sequence and contains at least one nucleotide with an attached molecule that is able to cleave double-helical DNA e.g. EDTA-Fe(II) (ethylenediamineterracetic acid-iron complex). The probes where the attached molecule is a label or compound that alters gene expression, are used for specific detection and/or cleavage of doublehelical DNA, e.g. for disgnosis, for treatment of disease (particularly caused by viruses, genetic defects or oncogenes), for chromosomal analysis, and for the isolation and mapping of genes. The present
                                                                                                                                                                                                                                                                                                                                                                                                                   New hybridization probe for specific triplex formation with large double helices, useful e.g. for site-specific diagnostic cleavage, contains attached functional residue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ODN-MGB-LF; oligonucleotide; minor groove binder; latent fluorophore; hybridisation; detection; fluorescence; probe; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is that of the oligonucleotide (ODN) component of an ODN-MGB (minor groove binder)-LF (latent fluorophore) conjugate of the invention. WGBB bind in a non-intercalating manner to the minor groove of non-single-stranded DNA, RNA or their hybrids, while a LF binds similarly but in an intercalating manner, or lies in the minor groove, or is cutented in some other way to the DNA molecule by MGB, such that it becomes fluorescent (or its fluorescent properties change detectably).

The conjugates are used as hybridisation probes and amplification primers for fluorescent detection of specifically hybridising sequences, for analysis or diagnosis, especially (real-time) PCR, for single-nucleotide mismatch discrimination, target or signal amplification, array-based assays and sequencing, including detection of double-stranded DNA by criples formation. Many different targets can be detected a single reaction vessel. The present ODN-MGB-LF conjugate was used to demonstrate hybridisation-triggered fluorescence. Upon hybridisation to the complementary target sequence there was an increase in fluorescence yield, measured as the ratio of the fluorescence emitted by the hybrid between the ODN-MGB-LF conjugate sequence of the fluorescence emitted by unhybridised (i.e. single-stranded) ODN-MGB-LF,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                      Conjugate of oligonucleotide, minor groove binder and latent fluorophore, useful for detecting specific nucleic acids, e.g. for single-nucleotide mismatch discrimination.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Cross-linked vinyl acetate copolymer carrier material, AIDS treatment, phosphorothioate; solid phase synthesis; modified oligonucleotide; clinical diagnostic; cancer treatment; ss.

hydrolysed cross-linked vinyl acetere copolymer carrier material loaded with nucleotide derivative(s). The product is an intermediate for the large (gram) scale solid phase synthesis of modified obligonucleotides useful e.g. as clinical diagnostics and therapeutics, e.g. for the treatment of AIDS and cancers. The presence of the partially hydrolysed copolymer facilitates the synthesis of larger amounts of oligonucleotides compared with the use of Merckogel (RTM, macroporous polyvinyl acetate) described in Nucleic Acid Res Sympos. Ser. 31, p. 153, 1994.

Cligonucleotides are obtained in very good quality and high yields, Also, the nucleosides do not display the reduced activity seen in some prior art procedures, less carrier material, reagents and solvent are required. Further, the carrier material is biodegradable and thus does not present disposal problems. It also swells uniformly in a range of solvents, which obviates expansion or contraction during use or solvent exchange.

AAH20510-AAH20513 represent oligonucleotides containing modified
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antisense therapy; antiproliferative; antiinflammatory; antipsoriatic; cytostatic; dermatological; cardiant; virucide; ophthalmological; keloid; skin disorder; Insulin-like Growth Factor I receptor; IGF-1; pityriasis; IGF binding protein; IGFBP-2; IGFBP3; inflammation; psoriasis; pilaris; growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba; keratosis; neoplasia; selaroderma; wart; skin cancer; sclerotic disease; hyperneovascular condition; hyperplasis; kidney disease; neovascular condition; hyperplasis; kidney disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Intermediate for oligonucleotide synthesis comprises partially hydrolysed cross-linked vinyl acetate copolymer loaded with nucleotide derivative.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes a novel chemical product comprising a partially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

antisense agents

New DNA-peptide nucleic acid chimeras, useful e.g. as antisense for treating e.g. cancer, also as diagnostic probes and primers.

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF4151 and AAF45153-64516). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperpoliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                        Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

This invention describes novel polyamide-oligomuclectide derivatives (I) and their physiologically acceptable salts of formula F((DNA)-Li)_g(PNA-Li) s(PNA)_Li) s(PNA)_Li). T(DNA-Li) s(PNA)_Li) a(PNA)_Li) and vasotropic activity and can be used for the inhibition of gene conservation by anticancer, antiproliferative, antiviral, hepatictisense, the intipoliferative and vasotropic activity and can be used for trapleholy activity and can be used for trapleholy and particular actions, for trapleholy and activity and antisense reagents. They are also useful in the increased affinity for complementary strands and better stability in the increased affinity for complementary strands and better stability in the increased affinity for complementary strands and better stability in the active than either DNA or PNA oligomers, when used as probes, (I) and advantages, i.e. have improved cellular uptake, do not aggregate in amplificant responses to base-pair mismatches in the DNA and PNA and PNA segments, allowing better discrimination between pathogenic conditions such as the transition from pathogenic and non-pathogenic conditions such as the transition from pathogenic and non-pathogenic conditions such as the transition from pathogenic and no elections such as the transition from pathogenic conditions such as the transition and pathogenic and no elections suc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 may be incorporated into a gene. This invention relates to oligonucleotide analogues comprising a protein nucleic acid molecule (PNA) monomer. They are used in the detection and connucled and confidence and molecules and as probes, primers, linkers, adapters and antisense agents on solid supports. Modifications enhance that use as capture and detection probes e.g. by the incorporation of their use as capture and detection probes e.g. by the incorporation of itorin, digoxigenen, radioisotopes, fluorescent labels such as illuminated are reporter molecules such as alkaline phosphatase. They are also used for enhancing or inhibiting the activity of an enzyme or callular activity. The compounds are stable to nucleases and proteases, backbone of PNAs is resistant to both nucleases and proteases. PNAs bind nucleic acid molecules with greater affinity than DNA or RNA concentration. The compounds are relatively simple to synthesize and are used in a wide variety of applications. This sequence represents a DNA oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Mutation detection method tag peptide coding sequence SEQ ID NO: 1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated avian and reptile nucleic acid, encoding a polypeptide with heparanase catalytic activity. The signal peptide of the nucleic acid can be used to express membrane-associated or secreted proteins in heterologus expression systems. The encoded polypeptides can be used to prevent tumour angiogenesis, metastasis and hinasion, and to intervene with pathologise associated with impaired heparin-binding growth factors, cellular responses to heparin-binding growth factors, cellular responses to heparin-binding growth factors and cytokines, cell interaction with plasma lipoproteins, cellular ususceptibility to viral, protezoa and bacterial infections or disintegration of neurodegenerative plaques. The present sequence represents a chicken heparanase (hpa) cDNA cloning oligo dI(15) primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nucleic acid encoding avian and reptile heparanase polypeptide is useful to treat various heparin-related disorders and the signal peptide is useful in production of membrane-targeted or secreted recombinant

The present invention relates to a method of detecting mutations in a nucleic acid by amplifying the nucleic acid to produce a double-stranded amplicon, in vitro transcription and translation of this amplicon, and detection of the transcription and translation of this amplicon, and detection of the translated protein. The primers used for amplification are designed to produce an amplicon that is translatable and allows of ifferentiation between translation products of wild-type and mutated nucleic acids. The method is used to detect mutations in tumour suppressor genes, for (early) diagnosis, monitoring and characterisation of tumours (especially of bladder and intestines) and in the germ line (using nucleic acids from embryos or blood cells). A new multi-tag vector is used to detect or verify the reading frame of a nucleic acid cloned in the and to determine the suitability of detectable peptides for analysis and/or purification of a recombinant protein, expressed from a sequence cloned in the invention Detecting mutations in nucleic acid, useful for diagnosis and characterization of tumors, by amplification, in vitro transcription and translation, then protein detection. Matches 15, Conservative AAD29506/ ò g ö The present invention relates to a method of detecting mutations in a nucleic acid by amplifying the nucleic acid to produce a double-stranded amplicon, in vitro transcription and translation of this amplicon, and detection of the translated protein. The primers used for amplification are designed to produce an amplicon that is translatable and allows differentiation between translation that is translatable and mutated nucleic acids. The method is used to detect mutations in tumour suppressor genes, for (early) diagnosis, monitoring and characterisation of tumours (especially of bladder and intestines) and in the germ line (using nucleic acids from embryos or blood cells). A new multi-tag vector is used to detect or verify the reading frame of a nucleic acid cloned in it, and to determine the suitability of detectable peptides for analysis and/or purification of a recombinant protein, expressed from a sequence cond in the vector. The present sequence encodes a tag peptide and was Detecting mutations in nucleic acid, useful for diagnosis and characterization of tumors, by amplification, in vitro transcription and translation, then protein detection. cellular properties of normal white adipose cells. The human pre-adipose cell lines are useful for the identification of substances controlling the regulation of lipid uptake and release by human white adipocytes, and substances controlling the differentiation of preadipocytes into mature adipocytes. They are useful for screening compounds capable to regulate the servetion of any metabolites or hormones from human white adipocytes. Sequences of the invention are useful for developing drugs, food ingredients and supplements against obesity, diabetes and cardiovascular diseases. The present DNA sequence is a reverse transcription (RT) -PCR primer which is used for the expression of adipocytes in differentiated immortalised human preadipose cells. This primer is used RNase inhibitor; anti-HIV; cytostatic; hepatotropic; antinflammatory; virucide; oncogene; cancer; transcription; translation; leukaemia virus; hepatitis virus; human immunodeficiency virus; retroviral; DNP-poly [A]; poly-2'-0-(2,4-dinitrophenyl)-poly [A]; viral reverse transcriptase; ss. Derivatized antisense oligoribonucleotide useful to inhibit e.g. viral reverse transcriptase comprises at the 2'-O position of the oligoribonucleotide, a hydrophobic carrier reagent containing a poly substituted phenyl compound. Roberts B, Pavco PA, Macejack D; Blatt L, Mcswiggen JA, New ribozymes targeting RNA derived from hepatitis C virus inhibit viral replication and are useful to treat hepatitis C virus infections and cirrhosis, liver failure or hepatocellular carcinoma.

Claim 1; Page 21; 80pp; English.

The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV of the substrate sequences defined in the specification and/or replication of HCV. They can be used to treat cirrhosts, liver failure and/or hepatocellular carcinoma. The HCV ribozymes are also useful for treating The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin (HP) motif where the binding arms comprise sequences complementary to one of the subserate sequences defined in the specification. The HCV ribozymes are useful for modulating the expression and/or replication of

ö
a condition associated with HCV infection in conjunction with one or more other drug therapies, particularly type I interferon, especially interferon alpha, beta or gamma or consensus interferon. The present sequence represents a substrate for a HCV hammerhead (HH) ribozyme. Note: Some of the sequence data for this patent did not form part of the printed specification. The complete sequence data for this patent was obtained in electronic format directly from the USPTO web site at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /mod_base= OTHER

The invention describes an improved process for immobilisation of macromolecules including DNA, RNA, peptide nucleic acids, pyranosyl-RNA and peptides, especially macromolecules containing multiple reactive sites, to a substrate surface or other conjugation target. It also describes the preparation of oligos containing one or more hydrazides,
amidite compound. The invention describes an improved process for immobilisation of macromolecules including DNA, RNA, peptide nucleic acids, pyranosyl-RNA and peptides, especially macromolecules containing multiple reactive sites, to a substrate surface or other conjugation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Compound for binding macromolecule to substrate surface or conjugation targets, contains phosphorous containing reactive group, hydrazide protecting group and benzene ring, and has predefined formula.
                                                                 target. It also describes the preparation of oligos containing one or more hydrazides, which can be used for conjugation to surface binding moieties, or for other conjugation reactions. The process is useful e. in nucleic acid hybridisation based assays, DNA chip technology and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Windhab N;

The invention describes an improved process for immobilisation of macromolecules including DNA, RNA, peptide nucleic acids, pyranosyl-RNA and peptides, especially macromolecules containing multiple reactive sites, to a substrate surface or other conjugation target. It also describes the preparation of oligos containing one or
which can be used for conjugation to surface binding moieties, or for other conjugation reactions. The process is useful e.g. in nucleic acid hybridisation based assays, DNA chip technology and biosensor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Compound for binding macromolecule to substrate surface or conjugation

The invention describes an improved process for immobilisation of macromolecules including DNA, RNA, peptide nucleic acids, pyranosyl-RNA and peptides, especially macromolecules containing multiple reactive sites, to a substrate surface or other conjugation target. It also describes the preparation of oligos containing one or more hydrazides, which can be used for conjugation to surface binding moieties, or for other conjugation reactions. The process is useful e.g. in nucleic acid hybridisation based assays, DNA chip technology and biosensor

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is of a hydrazine treated hydrazide precursor phosphoramidite 15-mer, designated oligo 033, which was produced in an example from the invention. The invention describes an improved process for immobilisation of macromolecules including DNA, RNA, peptide nucleic acids, pyranosyl-RNA and peptides, especially macromolecules containing multiple reactive sites, to a substrate surface or other conjugation more hydraides, which can be used for conjugation to surface binding moieties, or for other conjugation reactions. The process is useful e.g. in nucleic acid hybridisation based assays, DNA chip technology and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Compound for binding macromolecule to substrate surface or conjugation targets, contains phosphorous containing reactive group, hydrazide protecting group and benzene ring, and has predefined formula.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Windhab N;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is of a hydrazine treated hydrazide precursor phosphoramidite 15-mer, designated oligo 037, which was produced in an example from the invention. The invention describes an improved process for immobilisation of macromolecules including DNA, RNA, peptide nucleic acids, pyranosyl-RNA and peptides, especially macromolecules containing multiple reactive sites, to a substrate surface or other conjugation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Compound for binding macromolecule to substrate surface or conjugation targets, contains phosphorous containing reactive group, hydrazide protecting group and benzene ring, and has predefined formula.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       target. It also describes the preparation of oligos containing one or more hydrazides, which can be used for conjugation to surface binding moleties, or for other conjugation reactions. The process is useful ein nucleic acid hybridisation based assays, DNA chip technology and biosensor applications
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ż
